- Forensic Metal Detecting

John Volek has taught forensic metal detecting techniques to law enforcement agencies and college programs across the country.

Forensic Metal Detecting

By Bill Paxton

If you're like me, I'm sure every time that you watch some sort of police show on TV where the cops come in to search the crime scene with a metal detector you have one of two reactions. Either you burst out laughing when you see the police metal detecting "expert" swinging some ten cent garage sale variety

machine a foot over the ground, or your head hurts when you hear the "beeping" while they are searching that sounds like a microwave timer counting down. It really is both amusing and irritating that these shows that profess to be based upon real cases and procedures haven't a clue as to how a metal

detector really works or is used in the field.

You may not know this but there exists within our hobby a type of metal detecting specifically designed for exactly these sorts of situations. It is referred to as "crime scene metal detector operations" or most often as "forensic metal detecting." Never

CRIME SCENE METAL DETECTOR OPERATIONS

heard of it? Well, I had never heard of it either until I spoke with the owner of XTREME Scoops (www.extremescoops.com), John Volek. I was writing an article on sand scoops and called XTREME Scoops to get some information on their line of scoops. Not only was I surprised to have my call answered by a human being, but it also turned out to be John himself! In the course of our conversation about sand scoops, including discussing his state of the art titanium scoop, the Surf Master X2, John mentioned that he taught courses in

Notice anything not quite right about the metal detectors being used by officers who clearly haven't taken John Volek's class in forensic metal detecting?

Forensic metal detecting is most often conducted after hours. Note the absence of John’s recommended headlamp to make for easier hunting.

what he called “forensic metal detecting.” Needless to say, that caught my ear and I had to know more. While my priority at the time was my scoops article, I made a note to contact John at a later date to find

out more about forensic metal detecting.

It took a few months but I was finally able to connect with John. We kept trying but he is one busy guy! Not only does he run XTREME Scoops, but he

also is a full-time police lieutenant with the Sugar Land, Texas Police Department. Add to that the following:

- John runs his own metal detecting site, Houston Metal Detecting Services, that handles everything from lost ring and personal item recovery to detector training (<https://www.houston-metaldetectingservices.com/home.html>).

- He is also a professional instructor who specializes in teaching forensic metal detecting, traveling the country for TriTech Forensics (<https://www.tritechtraining.com/crime-scene-metal-detector-operations.html>).

- And he is a beekeeper!

John shared several

John also operates Houston Metal Detecting Services and is the owner of XTREME Scoops.

John Volek, forensic metal detecting expert and instructor.

stories with me about some of his best ring recoveries and also some “stinging” bee stories (sorry for the bad pun) but let’s focus on forensic metal detecting. First of all, just what is it? Forensic metal detecting is using a metal detector specially for the purpose of locating metallic items of evidence such as firearms, projectiles and shell casings at crime scenes. Prior to John’s involvement in this area, crime scene metal detecting was most times a scattershot approach involving either local hunters as volunteers or police officers trying their best to master a metal detector on the fly

while performing all of their other duties. John saw a need for both a refining and a “defining” of this process. It began with a simple referral from his YouTube Channel to the Houston Police Department Dive Team in the early 2000’s. The members of this team had received six Garrett Sea Hunter metal detectors and needed someone to show them how to use them. John came on board and created a two day course that focused on both land and water hunting. Along with this he refined the search grid that the team used when searching underwater that resulted in their being able to thoroughly search underwater crime scenes without miss-

John still finds time to hunt non-crime scene locations like ocean beaches with one of his metal detectors.

John instructing officers in the field at the Jacksonville State University Center for Applied Forensics.

ing anything.

As the old saying goes, good news travels fast. This success led John to working with the Houston Police Department Forensic Unit which later evolved into the standalone Forensic Science Center.

John continued to refine and expand this newly created area of expertise, building out a method that he felt could bring a new dimension and skill set to forensic teams across the country.

Enter Tri-Tech Forensics, a world leader in

forensics, that offered training in just about every area of forensics you can imagine. Except forensic metal detecting, that is. One conversation with John and he was instantly added to their large staff of forensic instructors. John now trav-

John demonstrating the use of a Garrett metal detector to a class.

John covers every aspect of crime scene metal detecting including teaching proper pinpointing techniques.

els the country instructing police departments and forensic teams in his proven

methods of forensic metal detecting.

In his course, while

not giving away his secrets, John guides his classes through a very extensive eleven part program that begins with the basic operation of a metal detector, followed by an understanding of crime scene assessment, interview (firsthand account), proper search grid and techniques, and ends with a focus on using a metal detector specifically at several mock crime scenes. His course is an amazingly thorough, sixteen hours that covers the following:

1. Introduction to the Garrett Metal Detector

- a. Operators Manual
- b. Metal Detectors Twelve Components and Optional Accessories
- c. Assembly
- d. Batteries, Power ON and OFF, and Factory

John Volek demonstrating water recovery techniques to an officer.

“Without complete coverage of an area a vital piece of evidence could be missed. John has devised several unique gridding methods for both land and water environments.”

Resetting

e. Metal Detector Control Panel

2. Target Information

a. Target ID Legend - Ferrous (iron) and Non-Ferrous

b. Target ID Cursor (Upper Scale) 20 graphic degree segments

c. Target ID Notch Discrimination Scale

d. Target ID Depth Indicator

e. Digital Target ID (1 thru 99)

3. Ground Balancing

a. Ground Balancing - Push Button Operation

b. Automatic Ground Balancing

c. Manual Ground Balancing

4. Frequency Adjustment

a. Frequency Adjustment (F1-F4) Interference Reduction

5. Tone ID and Tone Roll

John is a lieutenant with the Sugar Land, Texas, Police Department.

Audio

a. Low-Tones (ferrous target nails-iron)

b. Medium Tones (small non-ferrous, lead bullets, small shell casings)

c. High Tones (non-ferrous larger brass and copper bullet casings)

d. Tone Variations (target orientation and size)

6. Search Modes

a. Custom Mode (adjustable by the user will

be retained at power off)

b. Zero Mode (adjustable-not retained at power off)

7. Notch Discrimination

a. Notch Discrimination Notch DISC push buttons (+), (-)

b. Notch Discrimination (proportional discrimination)

8. Iron Discrimination

a. Iron Discrimination Setting 0-40 →

Shell casings are often times very important pieces of evidence that can only be located with the use of a metal detector.

- b. Iron Discrimination Push Buttons Operations
- c. Iron Discrimination and Combined Conductivity (multiple targets)

9. Iron Audio

- a. Iron Audio ON/OFF
- b. Iron Disc Settings (audible iron identification for enhanced target identification)

10. Bench or Air Testing

- a. Observe Digital Target ID's
- b. Discrimination
- c. Iron Audio

11. Field Metal Detecting

- a. Search Grids
- b. Sweeping the Coil
- c. Pinpointing
- d. Target Recovery

I know this seems like a ton of information but when you think about it, what John is teaching specific to forensic metal detecting has a lot in common with what we as recreational detectorists do when we go to hunt new areas. For example, John begins at a very logical starting point: learning the metal detector that you will be operating. As you can see from the rather humorous photos accompanying this article, some of the officers clearly needed John's course prior to hunting. But how different is that from the hunter who was so anxious to use a

John has designed highly refined and unique methods of searching water environments at crime scenes. Here are a few of the grids used to search underwater.

new detector that he/she ran right out to use it without even reading the owner's manual?

Let's take this a few steps further. When you arrive at an area to hunt, what is the first thing that you do? Assess the area perhaps? You go to a site and figure out the best areas

to hunt with the greatest potential for finding good targets. In forensic metal detecting, the crime scene is the environment and it needs to be accessed in the same way plus taking into consideration additional safety factors such as contaminants and blood borne pathogens. John recom-

mends that officers who may encounter these sort of high risk environments use a bootie to protect their searchcoils from contamination. Lighting is also a key safety concern since most crime scene investigation takes place after hours; headlamps are a must for these types of conditions.

Modified

Next up is what John refers to as the interview process. The “who, what, where, when, why and how” of evaluating a search environment. Very much like speaking to a property owner at a new permission, or a party who lost a valuable ring at the beach, right? Just a lot more detailed and complex.

Now we come to the subject of how to search a crime scene. Since the primary purpose of forensic metal detecting is to find metallic evidence, this is perhaps the most crucial phase. Without complete coverage of an area a vital piece of evidence could be missed. John has devised several unique gridding methods for both land and water environments, including a hybrid land/water method, to ensure that an area is completely covered. For those of us who hunt recreationally, this is gridding of the highest order!

Finally, the last part of John’s presentation is to have the officers hunt several mock crime scenes. Does

ONLY A MULTI-LINE DEALER CAN GIVE THE CUSTOMER A TRUE CHOICE

A WHOLESALE METAL DETECTING DISTRIBUTOR DOING BUSINESS WITH BUSINESSES SINCE 1977

If your dealership is handling only one or two metal detector brand lines, your customers are not getting the service they deserve. Outdoor Outfitters believes the customer should have every opportunity to view, handle and test a greater variety of products. The highest priced and flashiest detectors may not always be best suited for your customer’s physical preference, search location and budget. Becoming more educated and sensitive to your customer’s needs can earn you their respect, friendship, referrals, and repeated patronage.

Let’s face it, as a metal detector dealer your bottom line today is to remain in business and increase sales. We have the distribution power and the methodology to expand your business. Why not join our growing network of multi-line dealerships who are giving their customers every opportunity to become better detectorists.

FOR YOUR NEAREST DEALER OR DEALERSHIP INFORMATION,

The Garrett CSI 250, Minelab CTX 3030, Garrett CSI Pro and Garrett AT Pro are uniquely suited metal detectors for forensic metal detecting.

programmed to identify certain types of metallic targets common to crime scenes, vastly improving the ability of officers on the scene to gather forensic evidence. He also demonstrates the operation and use of a

that sound vaguely like having a test garden?

After many years of refining his techniques, John determined that Garrett metal detectors are the best metal detectors for use on land thanks to their unique notch discrimination display. His models of preference as mentioned earlier are the CSI 250, CSI Pro and the AT Pro. They can be

Garrett pinpointer, headphones and even a digging tool to teach proper recovery techniques. Water hunting, when required, is also

covered, including the use of his custom search grid and how to operate a metal detector in an underwater environment. John's current detector of choice is the Minelab CTX 3030 due to its GPS features, discrimination and trace targeting.

Is that a far cry from TV cop show metal detecting or what?

John's training has taken him across the country, teaching his methods to sheriff's departments, police departments and also university students studying forensics. As is very self-evident, his single minded devotion not only to law enforcement but also to the hobby of metal detecting has created what I think is one of the most ingenious, unique aspects of why we swing our coils. Yes, it's cool to find that old coin. Or that gold ring. Or even that piece of trash that once removed cleans up a landscape. But to think of the impact that a metal detector, now utilized as a valuable component of crime scene investigation, can have in finding key evidence that can help solve a crime? In my book, I'd put that right up there with the gold ring and old coin as an equally amazing find. "Forensic metal detecting." Thanks to John we now have a new side of our hobby that we can all be very proud of. □
